It has been accepted for inclusion in ME 4133/6133 Mechanical Metallurgy by an authorized administrator of Scholars Junction. For more information, please contact scholcomm@msstate.libanswers.com.

The Superhero of Bio-Metals: Co-Cr ASTM F-75

Co-Cr ASTM F75 is a combination of mostly Cobalt and Chromium along with other elements such as Molybdenum and Manganese that create an extremely **hard, tough, and long lasting** alloy.

Co-Cr ASTM F75 has best in class corrosion resistance and nearly **300%** higher endurance strength than even **Titanium**.

Co-Cr alloys are the top choice for medical implants such as knee and hip replacements. You probably know someone who has a Co-Cr implant in them **right now!**

Electron Beam Melting (EBM) :
A newly developed method of creating Co-Cr implants that uses **electron lasers** to allow much greater control of how the alloying elements are melted and dispersed.
